After launch, Apache quickly became the most popular web server on the Internet. The project is now developed and maintained, along with hundreds of other projects, by The Apache Software Foundation and is released under the terms of Apache License 2.0. What Is a Web Server? So, what does a web server do?

*Apache HTTP Server*

The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0. Apache is developed and maintained by an open community of developers under the auspices of the Apache Software Foundation. The vast majority of Apache HTTP Server instances run on a Linux distribution, but current versions also run on Microsoft Windows, OpenVMS, and a wide variety of Unix-like systems. Past versions also ran on NetWare

The Apache FtpServer application is a 100% pure Java FTP server. It's designed to be a complete and portable FTP server engine solution based on currently available open protocols. FtpServer can be run standalone as a Windows service or Unix/Linux daemon, or embedded into a Java application.

*Welcome to The Apache Software Foundation!*

Apache 2.0 introduces MPMS (multiple-processing modules) that hide the process model from most of the code. At runtime, Apache can be configured to use threads, processes, a hybrid of both or some other model. Modules can register new process models to suit their operating systems or the applications.
