Beat (acoustics) - Wikipedia
The equations of these lines are: $y_1 = \sin(2\pi f_1 t)$
 $y_2 = \sin(2\pi f_2 t)$ where the frequencies of each wave are f_1 and f_2 respectively, and t is the time. You can change the waves' frequencies by adjusting the corresponding sliders in the user interface.

For a single-frequency sound wave, the rate at which it does this is regular and continuous, taking the shape of a sine wave. Thus, the graph of a sound wave is a simple sine wave only if the sound has only one frequency component in it - that is, just one pitch. Most sounds are composed of multiple frequency components - multiple pitches.

Beat (acoustics) - Wikipedia

Beats are caused by the interference of two waves at the same point in space. This plot of the variation of resultant amplitude with time shows the periodic increase and decrease for two sine waves. The image below is the beat pattern produced by a London police whistle, which uses two short pipes to produce a unique and piercing three-note sound.

This equation shows that $y_1 + y_2$ is equivalent to a sine wave with a frequency of the average of f_1 and f_2 multiplied by another term with a frequency of half of the difference of f_1 and f_2 . It is this second term that is responsible for the beating effect, and is known as an envelope.

In the simplest case, beats result when two sinusoidal sound waves of equal amplitude and very nearly equal frequencies mix. The frequency of the resulting sound (F) would be the average of the two original frequencies (f_1 and f_2): The amplitude or intensity of the combined signal would rise and fall at a rate (f_b)
